

Product information:

The APG10 is a receiver gateway, designed to be used in combination with the Wall Line (WLI) and Wall Microphone (WMI) input units. It converts the signal transmitted over UTP CAT5 cabling into a signal corresponding line level and makes them available on an RCA output. The maximum distance that can be covered between the input unit and the receiver gateway is 300m. By applying a ARJ03P junction box halfway the cabling, which provides the required power supply for the input units, the maximum distance can be extended to 600 meters.
